

## Deck of Cards

How many cards in a deck? 52

How many suits? 4

How many cards in each suit? 13

## Warm Up:

Find the probability using a standard 52 card deck.

$$\begin{array}{ccccccc}
 P(\text{red}) & & P(J) & & P(<5) & & P(\heartsuit) \frac{13}{52} \quad \frac{1}{4} \\
 \frac{26}{52} & & \frac{1}{2} = (.5) & & \frac{4}{52} & & \frac{1}{13} \\
 \frac{1}{13} = (.08) & & \frac{4}{13} & & \frac{16}{52} = (.31) & & (.25)
 \end{array}$$

You conduct a phone survey and discover that 6 out of every 11 households shop at Costco. If there are 67,000 households in Lakewood, how many of those shop at Costco?

$$\frac{6}{11} = \frac{x}{67000}$$

$$36,945$$

**Learning Goal:** Today I will learn how to create a union of 2 events.

**Success Criteria:** I am able to calculate the probability of mutually exclusive or overlapping events.

# Compound Probability

## Probability Rules

Rules of probability

- 1) The probability of an event must be between 0 and 1
- 2) The sum of the probabilities of all possible outcomes must equal 1.
- 3) If two events have no outcomes in common, the probability that one or the other occurs is the sum of their individual probabilities.
- 4) The probability that an event does not occur is 1 minus the probability that it does occur.

Complement of an event: The probability that an event will NOT occur

If you have a 30% chance of snow, how likely is it NOT to snow?

## Compound Probability

Compound event - combination of 2 or more events using and/or

## OR: The Union of events.

Notation:  $P(A \cup B)$

Add the probabilities of event A and event B

$$P(A \cup B) = P(A) + P(B)$$

## Mutually Exclusive Events

[click for solutions](#)

Mutually exclusive events - no common outcomes

Example: Rolling a die:  
 $P(3 \text{ or even})$

$$\frac{1}{6} + \frac{3}{6} = \frac{4}{6} = 0.67$$

Set A has 1 number, and set B has 3 numbers.

add probabilities together

$$P(A \text{ or } B) = P(A) + P(B)$$

$$P(3 \text{ or even}) = \frac{1}{6} + \frac{3}{6}$$

## Mutually Exclusive Events

$$P(\text{Spade} \cup \text{Red}) = \frac{13}{52} + \frac{26}{52} = .75$$

$$P(< 4 \cup > 10) =$$

$$\frac{3}{13} + \frac{3}{13} = \frac{6}{13}$$

$$\frac{12}{52} + \frac{12}{52} = \frac{24}{52}$$

$$P(3 \cup 7 \cup K) =$$

$$\frac{4}{52} + \frac{4}{52} + \frac{4}{52} = \frac{12}{52} = .23$$

$\frac{1}{13}$

.416

## OR: Overlapping events

2 events can happen at the same time

Middle section counted twice so subtract one

$$P(A \cup B) = P(A) + P(B) - P(A \text{ and } B)$$

P(both at the same time)

## Overlapping Events

Overlapping events - some common outcomes

Example: Roll a die:

$P(\text{odd and } >3)$   
or

$$\frac{3}{6} + \frac{3}{6} - \frac{1}{6} = \frac{5}{6} = .83$$

## Overlapping Events

$P(\text{Spade} \cup 9) =$

$$\frac{13}{52} + \frac{4}{52} - \frac{1}{52} = \frac{16}{52} = .31$$

$$\frac{1}{4}$$

$P(<9 \cup \text{even}) =$

$$\frac{8}{13} + \frac{5}{13} - \frac{4}{13} = \frac{32}{52} + \frac{20}{52} - \frac{16}{52} = .69$$

$P(\text{Club} \cup \text{Black}) =$

$$\frac{13}{52} + \frac{26}{52} - \frac{13}{52} = \frac{26}{52} = \frac{1}{2} = .5$$

**Vacation** In a math class, 75% of the students have visited the ocean and 50% have visited the mountains on vacation before. If 45% of the students have visited the ocean and the mountains on vacation before, what is the probability that a randomly selected student has visited the ocean or the mountains?

Draw a Venn Diagram:

Probability:

$$.75 + .5 - .45 = .8$$

**Closure:** Today I learned how to calculate probability for mutually exclusive and overlapping events.
